The procedure for follow-up of data during EPD validity, as	□Voc M.No
defined by the GPI, involves third party verifier:	☐ Yes No
1 AND THE RESERVE OF THE CONTROL OF THE PARTY OF THE PART	6 H - FN -0 6 1-1 1 - 6 H - 1 OA H 1

'Not all requirements in the GPI are fulfilled, particularly the requirement, for construction products, to follow EN 15804 for certain aspects of the LCA method.

'This EPD is based on a PCR that satisfies procurement rules at the federal, state, and municipal levels which call for EPDs based on the UL Part B PCR. The UL Part B PCR was used to meet regulatory (example: Buy Clean California Act, etc.) and market expectations (example: Building Transparency EC3 comparisons, LEED and existing vendor procurement requirements, product scoring programs, etc.). The EPD should not be used outside of this context.

Limitations:
Environmental declarations from different programs (ISO 14025) may not be comparable.
The declared environmental performance in the EPD shall not be compared with EN 15804-compliant EPDs developed under PCR 2019.14 in the International EPD System.
Comparison of the environmental performance of Flooring Products using EPD information shall be based on the product's use and impacts at the building level, and therefore EPDs may not be used for comparability purposes when not considering the building energy use phase as instructed under this PCR.
Full conformance with the PCR for Products allows EPD comparability only when all stages of a life cycle have been considered. However, variations and deviations are possible*. Example of variations: Different LCA software and background LCI datasets may lead to differences results for upstream or downstream of the life cycle stages declared.
The EPD owner has the sole ownership, liability, and responsibility of the EPD.

Information about EPD Owner

Company Description

Founded in 1915, Mannington continues to pursue its commitment to quality, customer satisfaction and the environment through innovative product design and marketing, state-of-the-art processes, and industry-leading programs. It manufactures and supplies a portfolio of flooring products including residential and commercial sheet vinyl, luxury vinyl, laminate, hardwood floors, carpet, and rubber.

Product Information

Product Description

Mannington's Homogeneous Resilient Sheets is designed for superior performance in infection control spaces, meeting monolithic criteria per FGI guidelines—making it the ideal choice for operating rooms and perioperative spaces. Engineered with Quantum Guard ® Elite technology, it resists stains and abrasions while trapping less dirt, ensuring ease of cleaning and lower maintenance costs. Its through-chip color construction provides exceptional wear and durability, even under heavy traffic and rolling loads. With a psi rating ranging from 2,000 to 3,000 and slipresistant options, it enhances both safety and longevity. Available in 6'6" widths and thicknesses ranging from 2.03mm to 2.54mm, this flooring minimizes seams for a more efficient installation. Additionally, its ortho-phthalate and PFAS-free construction supports sustainability.

Figure 1: Product Construction

Application

Mannington Resilient Sheet products are used as interior flooring in healthcare, wellness environments, and hospitality interiors.

Figure 2: Product Application

Properties of Declared Product as Delivered

A standard Homogeneous 100 yd^2 roll is packaged with a cardboard core, two plastic plugs, two cardboard headers, and plastic wrap.

Product form (Tiles/Planks/Rolls)	Rolls				

Manufacturing Sites

Mannington Resilient Sheets are manufactured in Salem, NJ, United States.

Content Declaration

Manufacturing and Packaging

The manufacturing process for homogeneous sheet production involves four main stages:

- 1. Primary pellet tower: The primary pellet operation makes the individual pellet colors needed for each pattern. Raw materials, pigments are added to the Henschel mixer, where the ingredients are mixed into large pellet form. The pellets get discharged into a cooler, once cooled they are processed through a grinder and sizes through a granulator. The sized pellets are collected in bags.
- 2. Secondary Pelley Tower: The secondary pellet operation mixes the primary pellets as they are required for specific patterns. Multiple bags of different primary pellets are combined with more raw materials in a Henschel Mixer. Once mixed they are cooled. Once cooled they pass over a screener to remove oversized pellets and packaged into bags to head to the forming line.
- 3. Forming Lime: The forming line uses only secondary pellets to form a urethane acrylate-coated sheet of vinyl. The secondary pellets are emptied from the bag and screened again for more specific particle sizing. The pellets are distributed over a moving belt and compressed to achieve the desired thickness. The sheet passes through an oven where it forms a consolidated sheet. While still hot the sheet passes under an embossing roll for texture and then is cooled. A urethane acrylate coating is applied and cured. The sheet is wound on jumbo rolls at the end of the forming line.
- 4. Finishing: The sheets are cut, inspected, and packaged into salable roll lengths.

Table 2: Product Composition

Layer	Assurance III	BioSpec SR	BioSpec MD	Color Anchor Prism	BioSpec Armor
Acrylate	1.88%	1.58%	0.82%	0.82%	0.63%

Pigment	1.67%	2.00%	0.57%	0.57%	0.38%

Table 3: Packaging

Material	Value [kg per m²]	Biogenic Material Ikg C / m²]
Cardboard	4.09E-02	2.25E-02

There are no substances on the US EPA EPCRA EHS list present in Homogeneous Resilient Sheets at >100ppm. As such, no substances required to be reported as hazardous waste are associated with the production of this product.

Transportation

Raw materials are sourced from North America and Europe. It is assumed that all raw materials sourced from North America are delivered to the manufacturing facility via truck, based on global region, while materials sourced from Europe travel on an ocean ship, followed by a shipping leg by truck. Distances were calculated using the supplier location and the location of manufacturing. The

product is distributed from the manufacturing facility in Salem, NJ to customers in North America via truck.

Product Installation

The recommended method for installing Resilient Sheets is to use the full adhesive method. The instructions for this installation procedure can be found on the Mannington Commercial <u>website</u>.

The life cycle assessment modeled the installation stage with adhesive being applied at a rate of 0.3 kg/m².

All waste generated during installation, including packaging waste, is disposed of according to the tables found in Section 2.8.5 of *Part A: Life Cycle Assessment Calculation Rules and Report Requirements* from UL Environment.

Use

The table below shows the parameters for the use phase scenario undergoing study while Table 9 shows the total material and energy inputs required in the study. These inputs were estimated based on Mannington Resilient Sheets maintenance instructions. Resilient Sheet products are traditionally not repaired or refurbished and are only replaced if the product fails or a new look is desired. Detailed maintenance instructions for soft surface flooring are provided on Mannington's website.

Cleaning Process	Cleaning Frequency per year	Consumption of energy and resources
Sweeping	Daily	None
Damp mop/ Neutral cleaner	Weekly	Hot water, neutral detergent
Machine Cleaning	Monthly	Electricity

Table 4: Maintenance Procedure

Reference Service Life and Estimated Building Service Life

The service life for Homogeneous Resilient Sheets will vary depending on the amount of floor traffic, level of maintenance and the desired appearance of the floor covering. The reference service life for Resilient Sheets is 30 years. Therefore, after initial installation in a building with an estimated service life (ESL) of 75 years there will be 1.5 replacements needed after the initial installation. The RSL was selected based on the RCFI industry average EPD for each of the respective product categories.

Reuse, Recycling and Energy Recovery

Resilient Sheets can be easily disposed of, without any special handling requirements and without the threat of contamination.

Disposal

The product is considered to be 100% landfilled as specified in Sections 2.8.5 and 2.8.6 of Part A: Life Cycle Assessment Calculation Rules and Report Requirements from UL Environment.

Life Cycle Assessment Information

Flow Diagram

Figure 3: System Boundary

Declaration of Methodological Framework

The LCA follows an attributional approach.

Functional Unit

The functional unit of the flooring product is one (1) m² of floor covering. The mass per functional unit for the Homogeneous Resilient Sheets are 3.54 kg/m² for Assurance III, 3.68 kg/m² for BioSpec SR, 3.56 kg/m² for BioSpec MD and Color Anchor Prism, and 4.56 kg/m² for BioSpec Armor, all including installation adhesive. The total thickness is 80 mil for all homogeneous resilient sheets except BioSpec Armor which is 100 mil. (1 mil refers to one thousandth of an inch).

System Boundary

This EPD is a Cradle-to-Grave study.

Table 5: System Boundary and Modules

Module Name	Description	Analysis Period	Summary of Included Elements
A1	Product Stage: Raw Material Supply	2023	Raw Material sourcing and processing as defined by secondary data.
A2	Product Stage: Transport	2023	Shipping from supplier to manufacturing site. Fuel use requirements are estimated based on product weights and estimated distance.
А3	Product Stage: Manufacturing	2023	Energy and water inputs required for manufacturing products from raw materials. Packaging materials and manufacturing waste are included as well.

Module Name	Description	Analysis Period	Summary of Included Elements
A4	Construction Process Stage: Transport	2023	Shipping from manufacturing site to project site. Fuel use requirements are estimated based on product weights and mapped distance.
A5	Construction Process Stage: Installation	2023	Installation materials, installation waste and packaging material waste.
B1	Use Stage: Use	2023	Use of the product.
B2	Use Stage: Maintenance	2023	Cleaning energy, water, and materials, including refinishing the product.
В3	Use Stage: Repair	2023	Product typically not repaired during use.
В4	Use Stage: Replacement	2023	Total materials and energy required to manufacture a replacement.
B5	Use Stage: Refurbishment	2023	Product typically not refurbished during use.
В6	Operational Energy Use	2023	Operational Energy Use of Building Integrated System During Product Use
В7	Operational Water Use	2023	Operational Water Use of Building Integrated System During Product Use
C1	EOL: Deconstruction	2023	No inputs required for deconstruction.
C2	EOL: Transport	2023	Shipping from project site to waste disposal.
С3	EOL: Waste Processing	2023	Waste processing if incineration as chosen disposal pathway per Part A of the PCR.
C4	EOL: Disposal	2023	Disposal modeled by region as per Part A of the PCR.
D	Benefits beyond system	MND	Credits from energy or material capture.

Infrastructure and capital goods have been excluded from this assessment. By default, Sphera MLC datasets exclude infrastructure and capital goods.

Software

Sphera LCA for Experts 2024.2.

Period Under Review

The period under review is calendar year 2023.

Estimates and Assumptions

All estimates and assumptions are within the requirements of ISO 14040/44. The majority of the estimations are within the primary data. The primary data were collected as annual totals for manufacturing utilities and production volume. For the LCA, the manufacturing utilities were divided by the production to find an energy use per unit of mass. Another assumption is that the installation tools are used enough times that the per-square meter impacts are negligible

Cut-Off Criteria

A cut-off rule of 1% has been applied to this assessment, meaning the included inventory data must account for greater than 99% of the total material and energy inputs into the system. Furthermore, greater than 99% of the environmental impacts from the product system must be accounted for in the assessment. Additionally, packaging waste of inbound raw materials to Mannington facilities and

office waste were excluded. Cumulative excluded inputs within the life cycle account for less than 1% of the total mass inputs, energy inputs, and environmental impacts.

Data Sources

Primary data were collected by facility personnel and from internal management systems for all manufacturing processes. When primary data did not exist, secondary data for raw material production were utilized from Sphera MLC Database 2024.2.

Data Quality

The geographical scope of the manufacturing portion of the life cycle is the United States. All primary data were collected from the manufacturer. The geographic coverage of primary data is considered excellent. The primary data provided by the manufacturer represents all information for calendar year 2023. Time coverage of this data is considered excellent. Primary data provided by the manufacturer are specific to the technology used in manufacturing their product. They are site-specific and considered good quality. Data necessary to model cradle-to-gate unit processes were sourced from Sphera Managed LCA Content LCI datasets. Improved life cycle data from suppliers would improve technological coverage.

Process	Source type	Source	Reference year	Data category	Share of primary data, of GWP GHG results for A1-A3 ¹
Production of DOTP	Database	Sphera LCA for experts 2024.2	2023	Secondary Data	0%
Production of PVC	Database	Sphera LCA for experts 2024.2	2023	Secondary Data	0%
Generation of electricity used in manufacturing product	Database	Sphera LCA for experts 2024.2	2023	Primary Data	16%
Generation and use of natural gas in manufacturing	Database	Sphera LCA for experts 2024.2	2023	Primary Data	<1%
Transportation	Database	Sphera LCA for experts 2024.2	2023	Primary Data	4%
Total share of primary data, of GWP-GHG results for A1-A3					20%

¹The share of primary data is calculated based on GWP-GHG results. It is a simplified indicator for data quality that do not capture all relevant aspects of data quality. The indicator is not comparable across product categories. Values are the same for all products under this EPD.

Table 6: Declaration of data sources and share of primary data

Allocation

General principles of allocation were based on ISO 14040/44. To derive a per-unit value for manufacturing utilities, allocation based on total production by mass was adopted. As a default, secondary Sphera Managed LCA Content datasets use a physical basis for allocation.

Of relevance to the defined system boundary is the method in which recycled materials were handled. Throughout the study, recycled materials were accounted for via the cut-off method. Under this method, impacts and benefits associated with the previous life of a raw material from recycled stock are excluded from the system boundary. Additionally, impacts and benefits associated with secondary functions of materials at end of life are also excluded (i.e., production into

a third life or energy generation from the incineration plant). The study does include the impacts associated with reprocessing and preparation of recycled materials that are part of the bill of materials of the products under study.

Comparability and Benchmarking

The user of the EPD should take care when comparing EPDs from different companies. Assumptions, data sources, and assessment tools may all impact the uncertainty of the final results and make comparisons misleading. Without understanding the specific variability, the user is therefore, not encouraged to compare EPDs. Even for similar products, differences in use and end-of-life stage assumptions, and data quality may produce incomparable results. Comparison of the environmental performance of Flooring Products using EPD information shall be based on the product's use and impacts at the building level, and therefore EPDs may not be used for comparability purposes when not considering the building energy use phase as instructed under this PCR. Full conformance with the PCR for Products allows EPD comparability only when all stages of a life cycle have been considered. However, variations and deviations are possible. Example of variations: Different LCA software and background LCI datasets may lead to differences results for upstream or downstream of the life cycle stages declared.

Comparison of the environmental performance of construction works and construction products using EPD information shall be based on the product's use and impacts at the construction works level. In general, EPDs may not be used for comparability purposes when not considered in a construction works context. Given this PCR ensures products meet the same functional requirements, comparability is permissible provided the information given for such comparison is transparent and the limitations of comparability explained.

Life Cycle Assessment Interpretation

Within the Homogeneous Sheet lifecycle, replacements (B4) drive impacts across all TRACI 2.1 impact categories, except eutrophication, due to the 30-year service life of the product. The 30-year product service life means that 1.5 replacements of the Homogeneous Sheet will occur over the estimated 75-year service life of a building. Each replacement includes A1-A5 and C1-C4 lifecycle stages, explaining its outsized impact. For eutrophication maintenance (B2) drive TRACI 2.1 impacts. Within B2, all maintenance inputs across the 75-year service life are included.

Figure 4: TRACI 2.1 Impacts for Assurance III Resilient Sheet

Figure 5: TRACI 2.1 Impacts for BioSpec SR (80mil)

Figure 6: TRACI 2.1 Impacts for BioSpec MD (80mil)

Figure 7: TRACI 2.1 Impacts for Color Anchor Prism (80mil)

Figure 8: TRACI 2.1 Impacts for BioSpec Armor (100 mil)

Environmental Performance

All results are given per functional unit, which is 1 m² of installed flooring over an estimated building life of 75 years. The results of the end-of-life stage (module C) should be considered when using the results of the production stage. Environmental impacts were calculated using the Sphera LCA for Experts software platform. Impact results have been calculated using IPCC AR6, TRACI 2.1, and CML 2001-Jan 2016 characterization factors. LCIA results are relative expressions and do not predict impacts on category endpoints, the exceeding of thresholds, safety margins, or risks. The Impact Category Key table gives definitions of relevant acronyms.

The LCIA impact categories referenced in the abbreviations section are globally deemed mature enough to be included in Type III environmental declarations. Other categories are being developed and defined and LCA should continue making advances in their development. However, the EPD users shall not use additional measures for comparative purposes.

Additional Environmental Information

Environmental and Health During Manufacturing

Mannington's Homogeneous Sheets are produced in a facility that is ISO 14001 certified.

Environment and Health During Installation

The product should be installed according to the manufacturer's instructions on Mannington's website.

This is a non-hazardous product. According to the product's SDS, due to solid, inert properties, scrap pieces from installation may simply be swept up and disposed of as solid, non-hazardous waste per local, state, and federal regulations.

Extraordinary Effects

Fire

Mannington's Homogeneous Sheets received ≤ 450 on the ASTM E662 - NBS Smoke Test.

Water

Should the product become flooded, the floor covering should be removed, and the subfloor should be evaluated and repaired as needed. There are no environmental impacts associated with the product being flooded.

Mechanical Destruction

According to the product's SDS, this building product is relatively non-toxic, presenting no known hazard to people, except under thermal decomposition conditions which may yield hazardous by-products.

Environmental Activities and Certifications

Mannington's Homogeneous Sheets has a published <u>HPD</u> and <u>FloorScore certification</u>.

Additional information about the products can be found on Mannington's <u>Technical Resources</u> page.

Abbreviations

Table 21: Impact Category Key – LCIA Indicators

Abbreviation	Parameter	Unit
IPCC AR6		
GWPe	Global warming potential (100 years, excludes biogenic CO ₂)	kg CO₂ eq
GWPi	Global warming potential (100 years, includes biogenic CO ₂)	kg CO₂ eq
CML 2001-Jan	2016	
GWPe	Global warming potential (100 years, excludes biogenic CO ₂)	kg CO₂ eq
GWPi	Global warming potential (100 years, includes biogenic CO2)	kg CO₂ eq
ODP	Depletion of stratospheric ozone layer	kg CFC 11 eq
AP	Acidification potential of soil and water	kg SO₂ eq
EP	Eutrophication potential	kg Phosphate eq
POCP	Photochemical ozone creation potential	kg Ethene eq
ADPE	Abiotic depletion potential for non-fossil resources	kg Sb eq
ADPF	Abiotic depletion potential for fossil resources	MJ, net calorific value
TRACI 2.1		
AP	Acidification potential of soil and water	kg SO₂ eq
EP	Eutrophication potential	kg N eq
GWPe	Global warming potential (100 years, excludes biogenic CO ₂)	kg CO₂ eq
GWPi	Global warming potential (100 years, includes biogenic CO2)	kg CO₂ eq
ODP	Depletion of stratospheric ozone layer	kg CFC 11 eq
Resources	Depletion of non-renewable fossil fuels	MJ, surplus energy
SFP	Smog formation potential	kg O₃ eq

Table 22: Impact Category Key - Biogenic Carbon Indicators

Abbreviation	Parameter	Unit
BCRP	Biogenic Carbon Removal from Product	kg CO2
BCEP	Biogenic Carbon Emission from Product	kg CO2
BCRK	Biogenic Carbon Removal from Packaging	kg CO2
BCEK	Biogenic Carbon Emission from Packaging	kg CO2
BCEW	Biogenic Carbon Emission from Combustion of Waste from Renewable Sources Used in Production Processes	kg CO2
CCE	Calcination Carbon Emissions	kg CO2
CCR	Carbonation Carbon Removals	kg CO2
CWNR	Carbon Emissions from Combustion of Waste from Non- Renewable Sources used in Production Processes	kg CO2

Table 23: Impact Category Key – Resource Use, Waste, and Output Flow Indicators

Abbreviation	Parameter	Unit	
Resource Use Parameters			
RPRE	Use of renewable primary energy excluding renewable primary energy resources used as raw materials	MJ, net calorific value (LHV)	
RPRM	Use of renewable primary energy resources used as raw materials	MJ, net calorific value	
RPRT	Total use of renewable primary energy resources	MJ, net calorific value	
NRPRE	Use of non-renewable primary energy excluding non- renewable primary energy resources used as raw materials	MJ, net calorific value	
NRPRM	Use of non-renewable primary energy resources used as raw materials	MJ, net calorific value	
NRPRT	Total use of non-renewable primary energy resources	MJ, net calorific value	
SM	Use of secondary materials	kg	
RSF	Use of renewable secondary fuels	MJ, net calorific value	
NRSF	Use of non-renewable secondary fuels	MJ, net calorific value	
RE	Recovered energy	MJ, net calorific value	
FW	Net use of fresh water	m³	
Waste Parameters and Output Flows			
HWD	Disposed-of-hazardous waste	kg	
NHWD	Disposed-of non-hazardous waste	kg	
HLRW	High-level radioactive waste, conditioned, to final repository	kg	
ILLRW	Intermediate- and low-level radioactive waste, conditioned, to final repository	kg	
CRU	Components for reuse	kg	
MR	Materials for recycling	kg	
MER	Materials for energy recovery	kg	
EEE	Exported electrical energy	MJ	
EET	Exported thermal energy	MJ
